Health Context

State health measure • LA vs MS • selected year

LA	7.8%
MS	10.1%

Insights

- Across the 2007–2024 study period, homelessness patterns varied substantially by year and region across the six selected CoCs.
- Uninsured adult rates showed a moderate positive association with chronic homelessness across Louisiana and Mississippi ($r \approx +0.47$).
- Housing capacity, unsheltered homelessness, and public-health conditions vary across communities and should be interpreted together rather than as isolated measures.

Sources: HUD PIT/HIC • CDC/NCHS • BRFSS/PLACES • U.S. Census • LA & MS public health sources.

Notes: PIT counts are annual snapshots, not unique persons; availability varies by measure and year.

Missing data: Unavailable values remain N/A or NULL; they are not treated as zero.

Demographics: Under 18 and Veteran data begin 2011; ages 18–24 and Over 24 in 2013; Men and Women in 2014.

Recommendations

- Review unsheltered homelessness alongside local service availability to identify potential outreach and access gaps.
- Compare housing-program capacity and eligibility before interpreting differences in local housing availability.
- Examine healthcare access alongside housing conditions; observed correlations describe association and should not be interpreted as causation.
